# *migrate sim*

MIGRATION RATE AND POPULATION SIZE ESTIMATION
using the coalescent and maximum likelihood or Bayesian inference
Migrate-n version 3.6.4 [2177]
  Compiled for a SYMMETRIC MULTIPROCESSORS
Program started at   Thu Mar 20 16:43:49 2014
Program finished at   Thu Mar 20 16:55:44 2014

# *Options*

Datatype:                                                                          DNA sequence data

Inheritance scalers in use for Thetas:
All loci use an inheritance scaler of 1.0
[The locus with a scaler of 1.0 used as reference]
Random number seed:                               (with internal timer)        967600320
Start parameters:

Theta values were generated                                              from the FST-calculation

M values were generated                                                   from the FST-calculation

Connection type matrix:
  where m = average (average over a group of Thetas or M,
  s = symmetric M, S = symmetric 4Nm,  0 = zero, and not estimated,
  * = free to vary, Thetas are on diagonal

Population              1    2
 1 Pop__0               *    *
 2 Pop__1               *    *

 Order of parameters:
   1              $\Theta_1$                      <displayed>
   2              $\Theta_2$                      <displayed>
   3              $M_{2->1}$                      <displayed>
   4              $M_{1->2}$                      <displayed>

Mutation rate among loci:                                                                Mutation rate is constant for all loci

Analysis strategy:                                                                                        Bayesian inference

Proposal distributions for parameter

| Parameter | Proposal |
|---|---|
| Theta | Metropolis sampling |
| M | Metropolis sampling |

Prior distribution for parameter

| Parameter | Prior | Minimum | Mean* | Maximum | Delta | Bins |
|---|---|---|---|---|---|---|
| Theta | Uniform | 0.000000 | 2.500000 | 5.000000 | 0.500000 | 1500 |
| M | Uniform | 0.000000 | 500.000000 | 1000.000000 | 100.000000 | 1500 |

| Markov chain settings: | Long chain |
|---|---|
| Number of chains | 1 |
| Recorded steps [a] | 5000 |
| Increment (record every x step [b] | 100 |
| Number of concurrent chains (replicates) [c] | 1 |
| Visited (sampled) parameter values [a*b*c] | 500000 |
| Number of discard trees per chain (burn-in) | 10000 |

Print options:

# Bayesian Analysis: Posterior distribution over all loci
# *Log-Probability of the data given the model (marginal likelihood)*

Use this value for Bayes factor calculations:
BF = Exp[ ln(Prob(D | thisModel) - ln( Prob( D | otherModel)
or as LBF = 2 (ln(Prob(D | thisModel) - ln( Prob( D | otherModel))
shows the support for thisModel]

| Locus | Raw thermodynamic score(1a) | Bezier approximation score(1b) | Harmonic mean(2) |
|---|---|---|---|
| 1 | — | — | -836.95 |
| 2 | — | — | -970.37 |
| 3 | — | — | -669.72 |
| 4 | — | — | -932.91 |
| 5 | — | — | -847.84 |
| 6 | — | — | -767.52 |
| 7 | — | — | -851.12 |
| 8 | — | — | -852.83 |
| 9 | — | — | -786.80 |
| 10 | — | — | -933.93 |
| 11 | — | — | -706.58 |

| 14 | — | — | -661.93 |
| 15 | — | — | -931.28 |
| 16 | — | — | -757.23 |
| 17 | — | — | -827.46 |
| 18 | — | — | -1062.37 |
| 19 | — | — | -857.80 |
| 20 | — | — | -640.78 |
| All | — | — | -16418.34 |

(1a, 1b and 2) are approximations to the marginal likelihood, make sure that the program run long enough!
(1a, 1b) and (2) should give similar results, in principle.
But (2) is overestimating the likelihood, it is presented for historical reasons and should not be used
(1a, 1b) needs heating with chains that span a temperature range of 1.0 to at least 100,000.
(1b) is using a Bezier-curve to get better approximations for runs with low number of heated chains
[Scaling factor = 58.657125

## *Acceptance ratios for all parameters and the genealogies*

| Parameter | Accepted changes | Ratio |
|---|---|---|
| $\Theta_1$ | 556777/1248862 | 0.44583 |
| $\Theta_2$ | 696225/1250764 | 0.55664 |
| $M_{2 \to 1}$ | 452617/1251721 | 0.36160 |
| $M_{1 \to 2}$ | 535936/1250093 | 0.42872 |
| Genealogies | 285872/4998560 | 0.05719 |

# *MCMC-Autocorrelation and Effective MCMC Sample Size*

| Parameter | Autocorrelation | Effective Sampe Size |
|---|---|---|
| $\Theta_1$ | 0.67188 | 20736.85 |
| $\Theta_2$ | 0.67187 | 21130.75 |
| $M_{2\to1}$ | 0.91000 | 4865.63 |
| $M_{1\to2}$ | 0.93264 | 3540.20 |
| Ln[Prob(D|G)] | 0.93957 | 3119.96 |

## Potential Problems

This section reports potential problems with your run, but such reporting is often not very accurate. Whith many parameters in a multilocus analysis, it is very common that some parameters for some loci will not be very informative, triggering suggestions (for example to increase the prior range) that are not sensible. This suggestion tool will improve with time, therefore do not blindly follow its suggestions. If some parameters are flagged, inspect the tables carefully and judge wether an action is required. For example, if you run a Bayesian inference with sequence data, for macroscopic species there is rarely the need to increase the prior for Theta beyond 0.1; but if you use microsatellites it is rather common that your prior distribution for Theta should have a range from 0.0 to 100 or more. With many populations (>3) it is also very common that some migration routes are estimated poorly because the data contains little or no information for that route. Increasing the range will not help in such situations, reducing number of parameters may help in such situations.

Param 3 (Locus 7): Upper prior boundary seems too low!
Param 2 (Locus 14): Upper prior boundary seems too low!
